#### NARCAN NASAL SPRAY

## naloxone hydrochloride nasal spray

#### PART I: HEALTH PROFESSIONAL INFORMATION

#### SUMMARY PRODUCT INFORMATION

Route of Administration	Dosage Form / Strength	Nonmedicinal Ingredients
Intranasal	Solution for intranasal administration, 2 mg/0.1 mL (20 mg/mL) and 4 mg/0.1 mL (40 mg/mL)	Benzalkonium chloride, disodium ethylenediaminetetraacetate, sodium chloride, hydrochloric acid to adjust pH and purified water.

#### INDICATIONS AND CLINICAL USE

NARCAN NASAL SPRAY is a pure opioid antagonist indicated for emergency use to reverse known or suspected opioid overdose, as manifested by respiratory and/or severe central nervous system depression.

NARCAN NASAL SPRAY can be administered by a bystander (non-health care professional) before emergency medical assistance becomes available, but it is not intended to be a substitute for professional medical care. Emergency medical assistance (calling 911) should be requested immediately when an opioid overdose is suspected, before administering naloxone.

#### **CONTRAINDICATIONS**

 Patients who are hypersensitive to this drug or to any ingredient in the formulation or component of the container. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING.

## WARNINGS AND PRECAUTIONS

## **Serious Warnings and Precautions**

- Emergency medical assistance (calling 911) should be requested immediately when an opioid overdose is suspected, before using naloxone (see WARNINGS AND PRECAUTIONS, Rebound Opioid Toxicity).
- Individuals with a satisfactory response to an initial dose of naloxone should be kept under continued surveillance (see WARNINGS AND PRECAUTIONS, Rebound Opioid

NARCAN NASAL SPRAY Page 3 of 28

Toxicity).

Caregivers administering naloxone should be prepared to act in response to or assist the
patient in cases of potential adverse reactions such as aggressive reactions, convulsions
and vomiting. Special attention is warranted if naloxone is administered to a neonate or a
pregnant woman (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal
Syndrome and Special Populations, Pediatrics, Pregnant Women and DOSAGE AND
ADMINISTRATION).

#### General

In the absence of opioids, in opioid naïve people, naloxone administration shows essentially no pharmacologic activity. In opioid dependent people, naloxone may trigger an acute opioid withdrawal syndrome (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome).

The effectiveness of naloxone has not been assessed in people with intranasal conditions such as abnormal nasal anatomy, nasal symptoms (*i.e.*, blocked and/or runny nose, nasal polyps, etc.) or in people having a product sprayed into the nasal cavity prior to naloxone administration. It is unknown if these conditions affect naloxone's effectiveness. If NARCAN NASAL SPRAY is procured with the intention of using it in people that may present these conditions, the pharmacist may suggest other route of administration (*e.g.* intramuscular).

Naloxone does not counteract overdoses due to: barbiturates, benzodiazepines, psychostimulants (*e.g.*, cocaine, amphetamines, methylphenidate, etc.), alcohol, or any other non-opioid drug such as non-opioid tranquilizers, anesthetics or sedatives. However, mistakenly administering naloxone to a person that is unconscious because of a non-opioid overdose or for other reasons is unlikely to create more harm.

#### **Rebound Opioid Toxicity**

Rebound opioid toxicity is the re-emergence of an opioid overdose manifestation, including respiratory depression, following the temporary reversal of the opioid overdose with naloxone. The patient who has responded satisfactorily to naloxone should be kept under continued surveillance and repeated doses of naloxone should be administered as necessary until the emergency medical services take charge of the patient (see DOSAGE AND ADMINISTRATION). Repeated doses are often required as the duration of action of most opioids exceeds that of naloxone, and therefore, re-emergence of opioid overdose manifestation is likely.

#### Respiratory

Naloxone is not effective against respiratory depression due to non-opioid drugs (see WARNINGS AND PRECAUTIONS, General). A single dose of naloxone may not reverse respiratory depression (or reversal may be incomplete) if the opioid overdose is caused by certain partial agonist opioids such as buprenorphine and pentazocine or highly potent opioids such as

NARCAN NASAL SPRAY Page 4 of 28

fentanyl or its analogs. Additional doses of naloxone administered at close intervals may be required in such cases (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment). Similarly, an opioid overdose caused by very large doses of any opioid may also require administration of multiple doses of naloxone at close intervals (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment). In addition to naloxone, other resuscitative measures such as maintenance of a free airway, artificial ventilation and cardiac massage could be executed by a bystander (non-health care professionals) if the bystander knows how to perform the manoeuvres. Moreover, vasopressor agents should be employed (if available) whenever necessary if a health care professional is present.

## **Acute Opioid Withdrawal Syndrome**

NARCAN NASAL SPRAY should be administered with caution to persons who are known or suspected to be physically dependent on opioids. In such cases, an abrupt reversal of opioid effects may precipitate an acute opioid withdrawal syndrome. The severity of such a syndrome will depend on the degree of physical dependence, the dose and potency of the opioid that induced the overdose, and the dose of naloxone administered.

The signs and symptoms of an acute opioid withdrawal syndrome include, but are not limited to: body aches, pain, fever/pyrexia, sweating/hyperhidrosis, runny nose, sneezing, piloerection, yawning, weakness, asthenia, shivering, chills, tremor/trembling, convulsions/seizures, nervousness, restlessness, irritability, aggressive behavior, diarrhea, nausea, vomiting, abdominal cramps, increased blood pressure, and tachycardia. In the dependent neonate, signs also include excessive crying as well as hyperactive reflexes and the acute withdrawal may be life-threatening if not recognized and properly treated (see WARNINGS AND PRECAUTIONS, *Special Populations*, Pediatrics).

Emergency medical assistance (*i.e.*, calling 911) should be requested immediately when an opioid overdose is suspected. Monitor the patient for the development of the signs and symptoms of opioid withdrawal. Caregivers administering naloxone to any patient should always be prepared for potential reactions associated with acute opioid withdrawal syndrome and to assist the patient to minimize harm when experiencing these reactions. For example, a patient should be positioned in lateral decubitus to prevent choking if vomiting occurs; sharp or dangerous objects should be moved away in case of convulsions to protect the patient from injury, but the patient should not be restrained.

#### Cardiovascular

Rare cases of cardiac arrest, tachycardia and ventricular fibrillation have been reported after naloxone administration. These cases may have been confounded by the effects of other drugs or other effects such as prolonged hypoxia. A direct relationship to naloxone has not been established.

## **Post-Operative Consideration**

Several instances of hypotension, hypertension, ventricular tachycardia and fibrillation, dyspnea, pulmonary edema and rare cases of cardiac arrest have been reported. Death, coma, and

NARCAN NASAL SPRAY Page 5 of 28

encephalopathy have been reported as sequelae of these events. These events have primarily occurred in post-operative patients with pre-existing cardiovascular disorders and/or other drugs may have contributed to the adverse effects. A direct relationship to naloxone has not been established

## Neurologic

Convulsions or seizures after naloxone administration have been rarely reported and the relationship between naloxone and convulsion or seizure is unclear. If convulsions or seizures occur, sharp or dangerous objects should be moved away to protect the patient from injury but the patient should not be restrained.

#### **Psychiatric**

Irritability and aggressive behavior are among the manifestations of an acute opioid withdrawal syndrome, which may be precipitated when naloxone is administered to a person who is physically dependent on opioids (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome). Caregivers administering naloxone to any patient should always be prepared to manage potential aggressive reactions.

## Gastrointestinal

Naloxone administration could trigger gastrointestinal reactions including diarrhea, nausea, vomiting and abdominal cramps (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome). If vomiting occurs, the patient should be positioned in lateral decubitus to prevent choking.

## **Special Populations**

**Pregnant Women:** There are no adequate and well-controlled studies in pregnant women. Reproduction studies performed in mice and rats at doses up to 12 times the human dose revealed no evidence of impaired fertility or harm to the fetus due to naloxone. Administration of naloxone to an opioid-dependent pregnant woman may induce an acute opioid withdrawal syndrome (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome), which may precipitate preterm labor or fetal distress. Because of this risk and because animal reproduction studies are not always predictive of human response, naloxone should be used during pregnancy only if clearly needed (see DOSAGE AND ADMINISTRATION).

**Nursing Women:** It is not known whether naloxone is excreted in human milk. Studies in nursing mothers have shown that naloxone does not affect prolactin or oxytocin hormone levels.

**Pediatrics:** An accidental opioid exposure is possible in the pediatric population. Naloxone administration may cause an acute opioid withdrawal syndrome which may be life threatening in opioid dependent neonates if not recognized and properly treated (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome). Clinical data is limited and naloxone should be administered to a neonate only if clearly needed (see DOSAGE AND ADMINISTRATION). As for any use of naloxone, emergency medical assistance (*i.e.*, calling 911) should be requested immediately, before administering naloxone in a neonate.

NARCAN NASAL SPRAY Page 6 of 28

Geriatrics (> 65 years of age): Geriatric patients have a greater frequency of decreased hepatic, renal, or cardiac function and of concomitant disease or other drug therapy. Therefore, the systemic exposure of naloxone hydrochloride can be higher in these patients.

Clinical studies of naloxone hydrochloride did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients.

#### ADVERSE REACTIONS

In clinical studies, nasal edema, nasal inflammation, nasal dryness, nasal congestion, muscle spasms, musculoskeletal pain, headache, dizziness, constipation, nausea, toothache, rhinalgia, xeroderma, and blood pressure increased were reported.

Abrupt reversal of opioid effects in persons physically dependent on opioids may result in body aches, pain, fever/pyrexia, sweating/hyperhidrosis, runny nose, sneezing, piloerection, yawning, weakness, asthenia, shivering, chills, tremor/trembling, convulsions/seizures, nervousness, restlessness, irritability, aggressive behavior, diarrhea, nausea, vomiting, abdominal cramps, increased blood pressure, and tachycardia. In the neonate, it may result in excessive crying and hyperactive reflexes as well (see WARNINGS AND PRECAUTIONS, Acute Opioid Withdrawal Syndrome).

Hypotension, hypertension, ventricular tachycardia and fibrillation, dyspnea, pulmonary edema, and cardiac arrest have been associated with the use of naloxone post-operatively. Death, coma, and encephalopathy have been reported as sequelae of these events (see WARNINGS AND PRECAUTIONS, Cardiovascular, and Post-Operative Consideration). Excessive doses of naloxone hydrochloride in post-operative patients have resulted in significant reversal of analgesia, and have caused agitation.

Seizures have been reported to occur infrequently after the administration of naloxone; however, a causal relationship has not been established.

#### DRUG INTERACTIONS

#### **Drug-Drug Interactions**

Interactions with other drug products have not been established.

#### **Drug-Food Interactions**

Interactions with foods have not been established.

#### **Drug-Herb Interactions**

Interactions with herbal products have not been established.

NARCAN NASAL SPRAY Page 7 of 28

## **Drug-Laboratory Interactions**

Interactions with laboratory tests have not been established.

#### DOSAGE AND ADMINISTRATION

#### **Dosing Considerations**

Emergency medical assistance (*i.e.* calling 911) should be requested immediately when an opioid overdose is suspected, before administering naloxone (see WARNINGS AND PRECAUTIONS, Rebound Opioid Toxicity). NARCAN NASAL SPRAY is not a substitute for emergency medical care.

Since the duration of action of most opioids exceeds that of naloxone, the patient should be kept under continued surveillance and repeated doses of naloxone should be administered, as necessary (see WARNINGS AND PRECAUTIONS, Rebound Opioid Toxicity).

#### **Important Administration Instructions**

NARCAN NASAL SPRAY is for intranasal use only.

No additional device assembly is required.

Because treatment of suspected opioid overdose must be performed by someone other than the patient, be sure to inform caregivers, family members, and other persons around the patient about the presence/location of NARCAN NASAL SPRAY in the home as well as the PATIENT MEDICATION INFORMATION and *Quick Start Guide*.

The pharmacist (or other health care professionals providing advice to patients) should instruct the patient or caregiver to read the PATIENT MEDICATION INFORMATION and the *Quick Start Guide* at the time they obtain NARCAN NASAL SPRAY and to become familiar with the administration procedures. As well, the pharmacist should emphasize the following instructions to the patient or caregiver:

- Always seek emergency medical assistance (*i.e.* call 911), or ask someone to call for you, in the event of a suspected opioid overdose. If you encounter problems on how to administer NARCAN NASAL SPRAY or any other problem, the 911 operator will guide you.
- As soon as the 911 call is made or while someone else is calling for you, administer the lowest available strength of NARCAN NASAL SPRAY as quickly as possible because prolonged respiratory depression may result in damage to the central nervous system or death. Since the duration of action of most opioids exceeds that of naloxone hydrochloride and the suspected opioid overdose may occur outside of supervised medical settings, always keep the patient under continued surveillance until emergency personnel arrive.

NARCAN NASAL SPRAY Page 8 of 28

- Additional doses of NARCAN NASAL SPRAY, using an additional NARCAN NASAL SPRAY device, may be required until emergency medical assistance becomes available:
  - If the patient responds to the first dose of NARCAN NASAL SPRAY but relapses back into respiratory depression before emergency assistance arrives, administer repeated doses of NARCAN NASAL SPRAY as necessary.
  - o If the patient does not respond to the first dose of NARCAN NASAL SPRAY after 2-3 minutes, administer repeated doses of naloxone as necessary.
- **Do not reuse NARCAN NASAL SPRAY**. Each NARCAN NASAL SPRAY device contains a single dose of naloxone and cannot be reused.
- Administer NARCAN NASAL SPRAY in alternate nostrils with each dose.
- Administer NARCAN NASAL SPRAY according to the printed instructions in the PATIENT MEDICATION INFORMATION or Quick Start Guide.
- Place the patient on their back. Prior to administration, be sure the device nozzle is inserted in either nostril of the patient, and provide support to the back of the neck to allow the head to tilt back. In young children, the nozzle may not fit in the nostril. In this case, make sure the nozzle seals the nostril before administration.
- Do not prime or test the device.
- To administer the dose press firmly on the device plunger.
- Remove the device nozzle from the nostril after use.
- Turn patient on their side as shown in the PATIENT MEDICATION INFORMATION or Quick Start Guide.

## **Dosage forms NARCAN NASAL SPRAY is supplied in:**

- One carton containing 2 sprayer devices each providing a single 2 mg dose of naloxone hydrochloride in a 0.1 mL intranasal spray or;
- One carton containing 2 sprayer devices each providing a single 4 mg dose of naloxone hydrochloride in a 0.1 mL intranasal spray.

NARCAN NASAL SPRAY Page 9 of 28

## **Recommended Initial Dosing**

In all cases, the lowest available strength of NARCAN NASAL SPRAY should be used as the initial dose.

#### Dosing in Neonate Patients and pediatrics below 2 years of age

If NARCAN NASAL SPRAY is procured with the intention of use in this population, the pharmacist may suggest alternate formulations of naloxone (*e.g.* for intramuscular administration) which allow for smaller doses of naloxone.

Naloxone could trigger an acute opioid withdrawal syndrome in the dependent neonate which may be life-threatening if not recognized and properly treated. Naloxone should be administered to neonates only if clearly needed (see WARNINGS AND PRECAUTIONS, Special Populations, Pediatrics).

## Dosing in Pregnant Women

Naloxone could trigger an acute opioid withdrawal syndrome in the opioid-dependent pregnant woman, which may precipitate preterm labor or fetal distress (see WARNINGS AND PRECAUTIONS, Special Populations, Pregnant Women). To reduce the risk an acute opioid withdrawal syndrome in the opioid-dependent pregnant woman, the lowest available strength of NARCAN NASAL SPRAY should be used as the initial dose.

## **Repeat Dosing**

- The requirement for repeat doses of NARCAN NASAL SPRAY depends upon the amount, type, and route of administration of the opioid being antagonized;
- If the patient does not respond within 2-3 minutes to the first dose of NARCAN NASAL SPRAY, administer an additional dose of naloxone every 2-3 minutes (if additional doses are available), using a new NARCAN NASAL SPRAY device for each dose, until the desired response is obtained. If no response is obtained after 5 doses of the 4 mg NARCAN NASAL SPRAY or 10 doses of the 2 mg NARCAN NASAL SPRAY, an opioid overdose is unlikely to be the cause of the symptoms. In these cases, additional supportive and/or resuscitative measures may be helpful while awaiting emergency medical assistance;
- Once a desired response is obtained, continue surveillance of the patient while awaiting for emergency medical assistance and administer subsequent doses as necessary if the patient relapses back into respiratory depression;
- Administer NARCAN NASAL SPRAY in alternate nostrils with each dose.

NARCAN NASAL SPRAY Page 10 of 28

#### ACTION AND CLINICAL PHARMACOLOGY

#### **Mechanism of Action**

While the mechanism of action of naloxone hydrochloride is not fully understood, the preponderance of evidence suggests that naloxone antagonizes the opioid effects by competing for the same receptor sites.

#### **Pharmacodynamics**

NARCAN NASAL SPRAY prevents or reverses the effects of opioids, including respiratory depression, sedation, and hypotension. It can also reverse the psychosomimetic and dysphoric effects of agonist-antagonists such as pentazocine. NARCAN NASAL SPRAY is an essentially pure opioid antagonist, *i.e.*, it does not possess the agonistic or morphine-like properties characteristic of other opioid antagonists; naloxone does not produce respiratory depression, psychosomimetic effects or pupillary constriction.

Naloxone has not been shown to produce tolerance or to cause physical or psychological dependence.

#### **Pharmacokinetics**

Following administration, naloxone hydrochloride is rapidly distributed in the body. Naloxone hydrochloride is metabolized in the liver, primarily by glucuronide conjugation, and is excreted in urine.

NARCAN NASAL SPRAY Page 11 of 28

The study "Naloxone-Ph1a-002" was conducted to determine the PK of 4 different approaches to administer 3 different intranasal (IN) doses [2 mg (2 mg spray in one nostril), 4 mg (2 mg spray in each nostril), 4 mg (4 mg spray in one nostril), and 8 mg (4 mg spray in each nostril)] of naloxone compared to a 0.4 mg dose of naloxone administrated IM.

## **Study Demographics and Trial Design**

**Table 1 - Summary of Patient Demographics** 

Study #	Trial design	Dosage, route of administration and duration	Study subjects (n = number)	Mean age (Range)	Gender
Ph1a-002	Inpatient, Open- Label, Randomized, 5- Period, 5- Treatment, 5- Sequence, Crossover Study	Treatment A 2 mg – One Spray 20 mg/mL IN  Treatment B 4 mg - Two Sprays (1 per nostril) 20 mg/mL IN  Treatment C 4 mg - One Spray 40 mg/mL IN  Treatment D 8 mg - Two Sprays (1 per nostril) 40 mg/mL IN  Treatment E 0.4 mg IM	n = 30	35.9 years (22 - 55 years)	Female = 12 Male = 18

Subjects in study Naloxone-Ph1a-002 were more frequently male (60.0%), and more frequently African American or Black (76.7%). Two subjects were of Hispanic ethnicity. Subjects had an average height of 173.3 cm, weight of 80.1 kg, and a mean (range) body mass index (BMI) of 26.5 (19.6 to 29.8) kg/m<sup>2</sup>.

Participants were assigned to one of 5 sequences (Table 1), with 6 participants planned in each sequence. On the day after clinic admission, participants were administered study drug in randomized order with a 4-day washout period between doses until all 5 treatments had been administered. Blood was collected for PK analysis prior to administration and up to 12 hours after each dose; ECG, vital signs, and other AE assessments were performed.

Thirty participants were randomized, and received at least one dose of naloxone; 28 (93%) completed the study. One male participant was discontinued on Day 5 prior to receiving the second treatment due to a predose systolic blood pressure (BP) reading greater than 140 mmHg.

NARCAN NASAL SPRAY Page 12 of 28

# **Study Results**

Table 2 - Geometric Mean Pharmacokinetic Parameters (CV%) of Naloxone Following Intranasal Administration and Intramuscular Injection of Naloxone to Healthy Subjects.

Intranasai Aum	Treatment A	Treatment B	Treatment C	Treatment D	Treatment E
Parameter	2 mg - One Spray 20 mg/mL IN (N = 29)	4 mg - Two Sprays 20 mg/mL IN (N = 29)	4 mg - One Spray 40 mg/mL IN (N = 29)	8 mg - Two Sprays 40 mg/mL IN (N = 29)	0.4 mg IM (N = 29)

Figure 1 - Mean ± SD Plasma Concentration of Naloxone, (a) 0-6 h and (b) 0-1h Following Intranasal Administration and Intramuscular Injection

**(b)** 

NARCAN NASAL SPRAY Page 14 of 28

Naloxone plasma concentrations were at measurable concentrations 2.5 minutes after IN administration, the first collection time point, in all but 2 samples. The median  $t_{max}$  values after IN and IM dosing ranged from 20 to 30 minutes, indicating that naloxone was absorbed quickly following either route of administration.

Dose proportionality for the 4 IN doses of naloxone was assessed using the ratio of the dose-normalized geometric mean values ( $R_{dnm}$ ) of  $C_{max}$  and  $AUC_{0-inf}$ . The  $R_{dnm}$  value (90% confidence interval (CI)) value for  $C_{max}$  was 0.831 (0.744-0.927); for  $AUC_{0-inf}$ , the  $R_{dnm}$  value was 0.847 (0.786-0.912). Both  $C_{max}$  and  $AUC_{0-inf}$  increased slightly less dose proportionally, as indicated by  $R_{dnm}$  values less than 1 and confidence intervals that were outside the range of 0.80-1.25.

Evaluations were also done to compare the geometric mean ratios (GMR) of the dose-normalized PK parameters for one spray versus 2 sprays of the 20 mg/mL formulation; similar comparisons were done for the 40 mg/mL formulation. The GMRs for the PK parameters were between 94% and 97% when one spray (2 mg) and 2 sprays (4 mg) were delivered using the 20 mg/mL formulation. The values of the 90% CI for both AUC<sub>0-t</sub> and AUC<sub>0-inf</sub> were within 80-125% for the GMR while the values for C<sub>max</sub> were 78.7 to113%. For the 40 mg/mL formulation, the GMRs and 90% CIs for all 3 PK parameters were within the 80-125% range when results using one spray (4 mg) and two sprays (8 mg) were compared.

The conclusions of the PK study were that the naloxone nasal formulation can deliver a dose of naloxone intranasally with approximately 50% the bioavailability of IM administrations. As such, a 2 mg and 4 mg intranasal dose will provide a dose similar to intramuscular doses of 1 mg and 2 mg, respectively. The  $t_{max}$  is approximately the same as injectable naloxone indicating that time to onset of action will be similar.

#### STORAGE AND STABILITY

NARCAN NASAL SPRAY should be stored between 15°C to 25°C (excursions permitted up to 40°C), protected from light and in the blister and cartons provided. Do not freeze or leave NARCAN NASAL SPRAY in a car during winter. As well, NARCAN NASAL SPRAY should not be left in a car during hot summer days as the temperature can reach levels that will impair the integrity of naloxone.

If those situations occur, NARCAN NASAL SPRAY may lose its effectiveness and should be replaced. The potentially impaired units of NARCAN NASAL SPRAY device should only be discarded once a new blister of NARCAN NASAL SPRAY devices is available. If NARCAN NASAL SPRAY is needed and the potentially impaired unit of NARCAN NASAL SPRAY was not replaced it should be used.

NARCAN NASAL SPRAY Page 15 of 28

## DOSAGE FORMS, COMPOSITION, AND PACKAGING

## NARCAN NASAL SPRAY 2 mg/0.1 mL:

Each sprayer containing 0.1 mL of aqueous solution for intranasal administration contains: 2 mg naloxone hydrochloride, benzalkonium chloride (preservative), disodium ethylenediaminetetraacetate (stabilizer), sodium chloride, hydrochloric acid to adjust pH, and purified water.

## NARCAN NASAL SPRAY 4 mg/0.1 mL:

Each sprayer containing 0.1 mL of aqueous solution for intranasal administration contains: 4 mg naloxone hydrochloride, benzalkonium chloride (preservative), disodium ethylenediaminetetraacetate (stabilizer), sodium chloride, hydrochloric acid to adjust pH, and purified water.

#### NARCAN NASAL SPRAY is available as:

- 2 mg/0.1 mL single-dose sprayer, carton of 2 devices.
- 4 mg/0.1 mL single-dose sprayer, carton of 2 devices.

Latex-Free: NARCAN NASAL SPRAY is not made with dry natural rubber.

NARCAN NASAL SPRAY Page 16 of 28

## PART II: SCIENTIFIC INFORMATION

## PHARMACEUTICAL INFORMATION

## **Drug Substance**

Proper name: Naloxone hydrochloride

Chemical names: Morphinan-6-one, 4,5-epoxy-3,14-dihydroxy-17-(2-propenyl)-,

hydrochloride, (5α)-, dihydrate

17-Allyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one hydrochloride

dihydrate

Molecular formula and molecular mass: C<sub>19</sub>H<sub>21</sub>NO<sub>4</sub>,HCl,2H<sub>2</sub>O, 399.87

Structural formula:

Physicochemical properties: Naloxone hydrochloride, an opioid antagonist, is a synthetic

congener of oxymorphone. In structure, it differs from oxymorphone in that the methyl group on the nitrogen atom

is replaced by an allyl group.

General properties of naloxone hydrochloride are outlined below:

Appearance (color, physical form)	Naloxone hydrochloride is a white or off white powder
Solubility	Soluble in water, in dilute acids, and in strong alkali; slightly soluble in alcohol, practically insoluble in ether and in chloroform.
Melting range	177°C to 180°C Naloxone 200°C to 205°C Naloxone
Solution pH	The pH of an aqueous solution is in the range 2.5 to 3.5
Specific Rotation	-170° to -181°

NARCAN NASAL SPRAY Page 17 of 28

#### CLINICAL TRIALS

#### **DETAILED PHARMACOLOGY**

On the basis of animal experiments, naloxone is a relatively specific narcotic antagonist that interacts preferentially with the mu-receptor subtypes. Naloxone is devoid of opioid agonist effects and consequently it has no abuse potential.

Very low doses of narcotic antagonists, such as naloxone, are known to elicit aversive effects in morphine-dependent animals. When the dose of naloxone is increased, a similar aversive quality is manifested in animals, which are not dependent upon opioids. Examination of the basis for the production of aversive behavior in opioid-free animals suggests that the effects of naloxone are stereospecific and may possibly involve antagonism of endogenous opioid peptides.

In addition to antagonizing the effects of opioid drugs, naloxone has been reported to influence pharmacological responses to a variety of non-opioid drugs by antagonizing the secondary effects of these agents. Some of the effects of naloxone may be unrelated to the direct occupation of opioid receptors. For example, at very high doses naloxone appears to be a gamma aminobutyric acid (GABA) antagonist and this has been implicated in the convulsant properties associated with high doses of naloxone in rats.

Further, naloxone hydrochloride reverses the effects of opioids, including respiratory depression, sedation, and hypotension. In addition, it can reverse the psychotomimetic and dysphoric effects of agonist-antagonists, such as pentazocine and does not produce respiratory depression, psychotomimetic effects, or pupillary constriction. In the absence of narcotics or agonistic effects of other narcotic antagonists it exhibits essentially no pharmacologic activity.

#### **TOXICOLOGY**

#### **Acute and Sub-acute Toxicity**

Single-dose studies have been performed in mice, rats, guinea pigs, rabbits, cats, dogs, and monkeys using various routes of administration. The compound has an LD50 value ranging from 52 mg/kg IV in rabbits to over 500 mg/kg when given SC to adult rats. Newborn rats were more sensitive than adult animals with an LD50 of 260 mg/kg. In mice, the IV LD50 was  $150 \pm 5$  mg/kg and in rats  $109 \pm 4$  mg/kg.

Sub-acute studies (up to 30 days of treatment) have been performed in rats, monkeys, and dogs. Rats were given SC doses of naloxone in doses up to 200 mg/kg five days per week for four weeks, with convulsions at the highest dose being the only major reaction. Monkeys exhibited convulsions at 60 mg/kg given SC for 30 days. After 4 mg/kg IV for 14 days, dogs experienced hind limb weakness as the major effect.

NARCAN NASAL SPRAY Page 18 of 28

## **Mutagenesis and Carcinogenesis**

Naloxone was weakly positive in the Ames mutagenicity and in the in vitro human lymphocyte chromosome aberration test, but was negative in the in vitro Chinese hamster V79 cell HGPRT mutagenicity assay and in the in vivo rat bone marrow chromosome aberration study.

Long-term animal studies to evaluate the carcinogenic potential of naloxone have not been completed.

## Reproductive and Development Toxicology

Naloxone hydrochloride was administered during organogenesis to mice and rats at subcutaneous doses up to 10 mg/kg/day (equivalent to 6-times and 12-times, respectively, a human dose of 8 mg (two NARCAN NASAL SPRAY devices)) (based on body surface area comparison). These studies demonstrated no embryo toxic or teratogenic effects due to naloxone hydrochloride.

Pregnant female rats were administered 2 or 10 mg/kg naloxone subcutaneously from Gestation Day 15 to Postnatal day 21. There were no adverse effects on the offspring (up to 12-times a human dose of 8 mg/day (two NARCAN NASAL SPRAY devices) based on body surface area comparison).

#### PART III: PATIENT MEDICATION INFORMATION

#### READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

# NARCAN NASAL SPRAY naloxone hydrochloride nasal spray

2 mg and 4 mg

Read this carefully before administering **NARCAN NASAL SPRAY** and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about **NARCAN NASAL SPRAY**.

## **Serious Warnings and Precautions**

- Before administering NARCAN NASAL SPRAY, call 911 for emergency medical help. Do this immediately if you suspect or are aware of an opioid overdose.
- Make sure to watch the person who received NARCAN NASAL SPRAY. You may need
  to give additional doses of NARCAN NASAL SPRAY until emergency medical help
  arrives
- You may need to help the person who received NARCAN NASAL SPRAY. The patient may have a reaction such as becoming aggressive, shaking and/or vomiting. You will need to pay special attention when giving NARCAN NASAL SPRAY to a newborn who is less than four weeks old or a pregnant woman. Some of these reactions can be lifethreatening for a newborn or a fetus.

## What is NARCAN NASAL SPRAY used for?

NARCAN NASAL SPRAY is used to treat someone who has overdosed on opioids. NARCAN NASAL SPRAY can be used by anyone to reverse the effects of the overdose until medical help arrives. Signs of an opioid overdose include:

- trouble breathing or not breathing
- extreme drowsiness
- pale and clammy skin
- slow or no heartbeat
- passing out
- unable to be woken up by touch, shaking of shoulders or shouting
- very small pupils, like a pinpoint

NARCAN NASAL SPRAY Page 21 of 28

#### How does NARCAN NASAL SPRAY work?

Opioid drugs work by acting on specific receptors found in the brain and in the nervous system. When these drugs attach to those receptors, they reduce the amount of pain felt. Taking too many opioids can lead to an overdose and that can stop someone from breathing. The person may also experience other symptoms. NARCAN NASAL SPRAY stops the opioids from being attached to the receptors and this reverses the effects and symptoms of the overdose.

## What are the ingredients in NARCAN NASAL SPRAY?

Medicinal ingredient: naloxone hydrochloride

Non-medicinal ingredients: benzalkonium chloride, disodium ethylenediaminetetraacetate, sodium chloride, hydrochloric acid and purified water.

#### NARCAN NASAL SPRAY comes in the following dosage forms:

Each NARCAN NASAL SPRAY device contains either 2 mg or 4 mg in 0.1mL of solution.

#### Do not use NARCAN NASAL SPRAY if:

• you are sure that the patient is allergic to naloxone hydrochloride or to any of the ingredients in NARCAN NASAL SPRAY.

#### Warnings you should know about:

**Non-opioid overdoses:** NARCAN NASAL SPRAY does not reduce the effects of an overdose caused by other drugs such as:

- barbiturates
- benzodiazepines
- psychostimulants (for example: cocaine, amphetamines or methylphenidate)
- alcohol
- anesthetics
- sedatives.

Giving NARCAN NASAL SPRAY to a person because of a non-opioid overdose is unlikely to cause more harm.

**Return of Opioid Overdose Symptoms:** It may be possible that the signs of an opioid overdose return after a dose of NARCAN NASAL SPRAY has been given. For example, a patient who responded to the first dose may experience a return of the signs of an overdose.

## You should:

- monitor the patient.
- give repeated doses of NARCAN NASAL SPRAY to the patient if needed and available.
- lie the patient on their side to help them have a clear airway.
- perform artificial respiration or cardiac massage, only if needed and if you know how.
- wait for emergency medical help to arrive.

## **Acute Opioid Withdrawal Syndrome:**

NARCAN NASAL SPRAY Page 22 of 28

- NARCAN NASAL SPRAY should be given with caution to a patient who may be or who is addicted to opioids.
- After receiving NARCAN NASAL SPRAY, the patient may go into Acute Opioid Withdrawal Syndrome. Symptoms include:
  - shaking or having seizures
    - move away any sharp and dangerous objects to prevent injury.
    - do not try to hold the patient down.
  - o vomiting
    - place the patient on their side to prevent choking if they vomit.
  - o pain
  - o fever
  - o restlessness
  - o irritability
  - o aggressive behavior
  - o sweating
  - o yawning
  - o weakness
  - shivering
  - o trembling
  - o increased blood pressure
- Acute Opioid Withdrawal Syndrome can be life-threatening for a newborn. Symptoms in newborns also include:
  - o excessive crying
  - o twitching and hyperactive reflexes.

#### **Heart problems:**

Naloxone is the active ingredient in NARCAN NASAL SPRAY. After using naloxone some patients had:

- a heart attack
- an increased heart rate
- an irregular heartbeat.

These side effects were rare. It is not known if the reactions were caused by naloxone or by the overdose.

NARCAN NASAL SPRAY Page 23 of 28

**Patients who have had surgery**: The following occurred when some patients who had a recent surgery received naloxone:

- high and low blood pressure
- increased heart rate
- rapid irregular heartbeat
- a build-up of fluid in the lungs
- in rare cases, cardiac arrest

These side effects were rare. It is not known if the reactions were caused by naloxone or by the overdose.

**Patients with nasal problems:** It is not known if having any nasal problems will impact how NARCAN NASAL SPRAY works. Examples of nasal problems include a blocked or runny nose or nasal polyps. If NARCAN NASAL SPRAY is the only medication available to treat an opioid overdose, it should always be used.

**Pregnant Women:** NARCAN NASAL SPRAY should only be used in pregnant women when clearly needed.

#### **How to Administer NARCAN NASAL SPRAY:**

#### **Important Points:**

- NARCAN NASAL SPRAY is for use in the nose only.
- Do not test the NARCAN NASAL SPRAY device. Keep NARCAN NASAL SPRAY in the package until it is needed.
- Each NARCAN NASAL SPRAY device contains only 1 dose and cannot be reused.
- NARCAN NASAL SPRAY is not a substitute for emergency medical care. Always call 911 before administering NARCAN NASAL SPRAY.

#### Dose:

- NARCAN NASAL SPRAY is available as a 2 mg or 4 mg nasal spray device.
- The lowest available strength should be used as the initial dose.
- The pharmacist may recommend using an alternate form of naloxone in newborns or children under two years old. This is because smaller doses can be given with the injectable form of naloxone.

NARCAN NASAL SPRAY Page 24 of 28

## Step 1: Identify Opioid Overdose & Call for Emergency Medical Help.

## Check for signs of an opioid overdose:

- Person DOES NOT wake up after you shout, shake their shoulders, or firmly rub the middle of their chest.
- o Breathing is very slow, irregular or has stopped.
- o Center part of their eye is very small, like a pinpoint.

Call 911 or ask someone to call for you.

Lay the person on their back.

## Step 2: Give NARCAN NASAL SPRAY

**Remove** device from Packaging. **Do not test the device.** There is only one dose per device.

**Hold the device** with your thumb on the bottom of the plunger. Put your first and middle fingers on either side of the nozzle.

# Gently insert the tip of the nozzle into one nostril.

Your fingers should be right up against the nose. If giving to a child, make sure the nozzle seals the nostril.

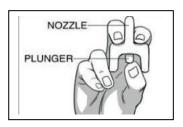

**Press the plunger firmly** with your thumb to give the dose.

**Remove** the device from the nostril.

NARCAN NASAL SPRAY Page 25 of 28

## **Step 3: Evaluate and support**

**Move** the person on their side (recovery position). Watch them closely.

Give a second dose after 2 to 3 minutes if the person has not woken up or their breathing is not improved. Alternate nostrils with each dose.

You can give a dose every 2 to 3 minutes, if more are available and are needed.

**Perform artificial respiration or cardiac massage** until emergency medical help arrives, if you know how and if it is needed.

## What are possible side effects from using NARCAN NASAL SPRAY?

- Swelling in the nose
- Dryness in the nose
- Congested nose
- Runny nose
- Yawning
- Nervousness
- Pain
- Aggressive behaviors, irritability, restlessness, agitation
- Blood pressure increased
- Increased heart rate
- Nausea, vomiting
- Diarrhea, abdominal cramps
- Shivering, chills, tremors, trembling
- Fever
- Sweating
- Weakness
- Seizures
- Shaking
- Muscle spasms
- Dizziness
- Headache

911 should be called before administering NARCAN NASAL SPRAY. This will ensure the patient gets the help needed to deal with any overdose symptoms and any side effects.

NARCAN NASAL SPRAY Page 26 of 28

## **Reporting Side Effects**

You can help improve the safe use of health products for Canadians by reporting serious and unexpected side effects to Health Canada. Your report may help to identify new side effects and change the product safety information.

## 3 ways to report:

- Online at MedEffect (http://hc-sc.gc.ca/dhp-mps/medeff/index-eng.php);
- By calling 1-866-234-2345 (toll-free);
- By completing a Consumer Side Effect Reporting Form and sending it by:
  - Fax to 1-866-678-6789 (toll-free), or
  - Mail to: Canada Vigilance Program
    Health Canada, Postal Locator 1908C
    Ottawa, ON
    K1A 0K9

Postage paid labels and the Consumer Side Effect Reporting Form are available at MedEffect.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

## **Storage:**

- Keep NARCAN NASAL SPRAY in its box until ready to use.
- Store between 15°C to 25°C.
  - o NARCAN NASAL SPRAY may be stored for short periods up to 40°C.
  - o Do not store NARCAN NASAL SPRAY in the car on hot summer days.
  - o Do not freeze or leave NARCAN NASAL SPRAY in a car during the winter.
  - o NARCAN NASAL SPRAY may not be as effective if it is not stored properly. If NARCAN NASAL SPRAY gets frozen or is stored at 40°C for long periods of time, you should replace it. Only discard the NARCAN NASAL SPRAY once you have a replacement for it. If you don't replace NARCAN NASAL SPRAY before it is needed, it is better to use it, even if it hasn't been stored properly.
- Store in a dark place and protect from light.
- Replace NARCAN NASAL SPRAY before the expiration date on the box.
  - o If only expired NARCAN NASAL SPRAY is available, it should be used in an overdose situation.
- Keep out of reach and sight of children.
